

## Mobile Access to Shared Workspaces: QuickPlace for the Palm OS

Lotus QuickPlace is a revolutionary Web-based application that lets users instantly create a shared workspace—a QuickPlace. Because creation is so easy, any project or initiative can afford its own place, which members can go to communicate, look up information, and manage the project's schedules.

What problem does QuickPlace solve? Typically, when people are working towards a common goal, they send email to one another containing valuable information. Multiple revisions are sent back and forth, and ultimately critical resources get lost - “I can’t find that email”, cries one team member; “Are you sure we’re looking at the same proposal?” cries another. When someone new joins the effort, they have no easy way to recover the

historical information necessary to “get up to speed”.

QuickPlace enables teams to maintain all resources (files, thoughts, schedules, etc.), related to a common effort in a common place, where everyone can be assured that they can find and respond to the latest information.

QuickPlace is revolutionary in the way that it lets you, with only your internet browser, effortlessly create a space for your community that is both visually exciting and incredibly supportive of your team’s activities.

For more information on QuickPlace see [www.quickplace.com](http://www.quickplace.com).

### **Mobile Access to QuickPlace**

QuickPlace for Palm OS allows access to a team’s QuickPlace from anywhere. Using only a hotsync cradle, you can grab the contents of a QuickPlace for later review. Using a modem, you can receive updated information from the road or post new content to the Place. Using a wireless Palm VII, you can stay send and receive content without the need for a phone line.

QuickPlace for Palm OS will break new ground in Palm user interface design. Navigation and content browsing will be optimized for the small screen and stylus input of the Palm. Communications cost will be kept low through content transcoding and client side caching.
